

# 1,2-Bis[bis[4-(trifluoromethyl)phenyl]-phosphino]ethane

Matthew A. Bork, Aaron M. Krueger, Robin S. Tanke\* and James G. Brummer

Department of Chemistry, University of Wisconsin – Stevens Point, Stevens Point, WI 54481, USA

Correspondence e-mail: rtanke@uwsp.edu

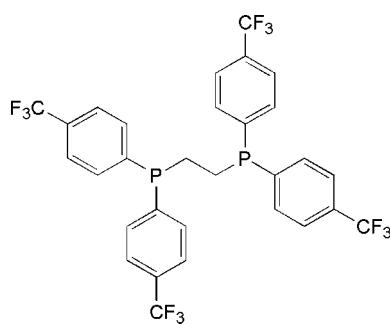

Received 28 November 2007; accepted 27 December 2007

Key indicators: single-crystal X-ray study;  $T = 208\text{ K}$ ; mean  $\sigma(\text{C–C}) = 0.004\text{ \AA}$ ;  $R$  factor = 0.061;  $wR$  factor = 0.162; data-to-parameter ratio = 15.5.

Crystals of the title compound,  $\text{C}_{30}\text{H}_{20}\text{F}_{12}\text{P}_2$  or  $R_2\text{PCH}_2\text{CH}_2\text{PR}_2$  ( $R = 4\text{-C}_6\text{H}_4\text{CF}_3$ ), were inadvertently prepared while attempting to recrystallize a crude sample of *trans*- $\text{Re}(\text{Cl})(\text{N}_2)(R_2\text{PCH}_2\text{CH}_2\text{PR}_2)_2$  from diethyl ether. The molecule lies on a center of inversion. One of the rings lies approximately in the  $\text{P–C–C–P}$  plane; the dihedral angle is  $174.53^\circ$ . The other ring is not quite perpendicular; the dihedral angle is  $71.1^\circ$ . The compound is isostructural with the  $R = \text{Ph}$ ,  $4\text{-C}_6\text{H}_4\text{CH}_3$  and  $4\text{-C}_6\text{H}_4\text{CH}_2\text{CH}_3$  analogues. It is well known that the basicity of phosphines and diphosphines can be altered by changing the electron-donating ability of  $R$ ; however, the structural parameters for the title compound do not significantly differ from those of the aforementioned substituted-phenyl compounds.

## Experimental

### Crystal data

$\text{C}_{30}\text{H}_{20}\text{F}_{12}\text{P}_2$	$V = 1468.3 (19)\text{ \AA}^3$
$M_r = 670.41$	$Z = 2$
Monoclinic, $P2_1/n$	$\text{Mo K}\alpha$ radiation
$a = 15.188 (11)\text{ \AA}$	$\mu = 0.24\text{ mm}^{-1}$
$b = 5.402 (4)\text{ \AA}$	$T = 208\text{ K}$
$c = 18.123 (13)\text{ \AA}$	$0.40 \times 0.10 \times 0.10\text{ mm}$
$\beta = 99.044 (9)^\circ$	

### Data collection

Bruker SMART APEXII	9947 measured reflections
diffractometer	3240 independent reflections
Absorption correction: multi-scan (SADABS; Sheldrick, 2006)	2616 reflections with $I > 2\sigma(I)$
	$R_{\text{int}} = 0.044$
	$T_{\min} = 0.91$ , $T_{\max} = 0.98$

### Refinement

$R[F^2 > 2\sigma(F^2)] = 0.061$	208 parameters
$wR(F^2) = 0.162$	H-atom parameters constrained
$S = 0.95$	$\Delta\rho_{\max} = 0.73\text{ e \AA}^{-3}$
3229 reflections	$\Delta\rho_{\min} = -0.43\text{ e \AA}^{-3}$

Data collection: APEX2 (Bruker, 2006); cell refinement: APEX2; data reduction: APEX2; program(s) used to solve structure: SHELXS97 (Sheldrick, 2008); program(s) used to refine structure: CRYSTALS (Betteridge *et al.*, 2003); molecular graphics: CAMERON (Watkin *et al.*, 1996); software used to prepare material for publication: CRYSTALS.

### 1,2-Bis{bis[4-(trifluoromethyl)phenyl]phosphino}ethane

**M. A. Bork, A. M. Krueger, R. S. Tanke and J. G. Brummer**

#### Comment

1,2-Bis{bis[4-(trifluoromethyl)phenyl]phosphino}ethane was obtained accidentally during the recrystallization of *trans*- $\text{Re}(\text{Cl})(\text{N}_2)(R_2\text{PCH}_2\text{CH}_2\text{PR}_2)_2$  [ $R = 4\text{-Ph}-\text{CF}_3$ ] from diethyl ether. We were interested in preparing this complex in order to measure its luminescent properties and then compare them to those for the analogous  $R = \text{Ph}$ ,  $4\text{-Ph-OCH}_3$ , and  $\text{CH}_2\text{CH}_3$  complexes. Our preliminary results indicate that these complexes show simultaneous emission from two excited levels of different orbital parentage. Our intent is to investigate how changes in diphosphine basicity brought about by variations in  $R$  influence the bandshape and lifetimes of these emissions thereby allowing us to assign the excited states responsible for luminescence.

The title compound resides on a center of inversion. It is isostructural to its  $R = \text{Ph}$ ,  $4\text{-Ph}-\text{CH}_3$ , and  $4\text{-Ph}-\text{CH}_2\text{CH}_3$  analogues. It is well known that the basicity of phosphines and diphosphines can be altered by changing the electron donating ability of  $R$ ; however, the structural parameters for the title compound do not significantly differ from the aforementioned phenyl substituted compounds.

A summary of the C—P bond distances, C—P—C bond angles, and sums of the C—P—C angles is given in Table 1 for this work and several related diphosphines that contain aromatic and aliphatic substituents. The title compound has nearly identical geometric parameters about phosphorus as the other phenyl diphosphines and there appears to be no experimentally significant trends that parallel the electron donating ability of the *para*-substituent, which follows the order  $\text{CH}_3\text{CH}_2 > \text{CH}_3 > \text{H} > \text{CF}_3$  (Nordwig *et al.*, 2006; Allman & Goel, 1982; Tolman, 1970; Streuli, 1960). The aromatic diphosphines display  $\Sigma \text{C—P—C}$  values of about  $303.5^\circ$  which indicates a pyramidal arrangement of the bonds about phosphorus. The aliphatic diphosphines are more electron donating with the less sterically demanding  $R = \text{CH}_3$  and  $\text{CH}_2\text{CH}_3$  cases giving rise to lower  $\Sigma \text{C—P—C}$  values. The  $R = \text{CH}(\text{CH}_3)_2$  and  $\text{C}(\text{CH}_3)_3$  compounds display larger  $\Sigma \text{C—P—C}$  values and longer C—P bond distances due to increased space requirements for these bulkier substituents. Substituent effects for the alkyl substituted compounds have been discussed previously (Bruckmann & Kruger, 1997; Eisentrager *et al.*, 2003).

One of the rings lies approximately in the P—C—C—P plane; the dihedral angle is  $174.53^\circ$ . The other ring is not quite perpendicular; the dihedral angle is  $71.1^\circ$ .

#### Experimental

A non-crystalline sample of  $R_2\text{PCH}_2\text{CH}_2\text{PR}_2$  [ $R = 4\text{-Ph}-\text{CF}_3$ ] and a crude sample of *trans*- $\text{Re}(\text{Cl})(\text{N}_2)(R_2\text{PCH}_2\text{CH}_2\text{PR}_2)_2$  [ $R = 4\text{-Ph}-\text{CF}_3$ ] were prepared according to previously reported methods (Chatt, *et al.*, 1985). Crude *trans*- $\text{Re}(\text{Cl})(\text{N}_2)(R_2\text{PCH}_2\text{CH}_2\text{PR}_2)_2$  was dissolved in a minimum of diethyl ether at  $20^\circ \text{C}$ . The yellow-orange solution was filtered and ether was gradually evaporated by passing a slow stream of nitrogen gas through the flask. A mixture of microcrystalline orange solid and pale yellow-orange crystals formed over the course of 4 h. A pale crystal from this mixture was analyzed.

## Refinement

Reflections (11) in the vicinity of the beam stop, with  $[\sin \theta/\lambda]^2 < 0.01$ , were eliminated from the refinement.

All H atoms were positioned geometrically and refined using a riding model, with C—H = 0.93 Å for aromatic H atoms and 0.96 Å for methylene H atoms, and with  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ . An extinction correction (Larson, 1970) was applied.

## Figures

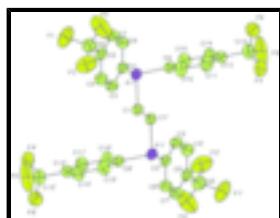

Fig. 1. The title compound with displacement ellipsoids drawn at the 50% probability level.  
Symmetry code:  $i = -x + 2, -y + 2, -z$ .

## 1,2-Bis{bis[4-(trifluoromethyl)phenyl]phosphino}ethane

### Crystal data

$\text{C}_{30}\text{H}_{20}\text{F}_{12}\text{P}_2$	$F_{000} = 676$
$M_r = 670.41$	$D_x = 1.516 \text{ Mg m}^{-3}$
Monoclinic, $P2_1/n$	Melting point: 471 K
Hall symbol: -P 2yn	Mo $K\alpha$ radiation $\lambda = 0.71073 \text{ \AA}$
$a = 15.188 (11) \text{ \AA}$	Cell parameters from 4592 reflections
$b = 5.402 (4) \text{ \AA}$	$\theta = 2.3\text{--}27.2^\circ$
$c = 18.123 (13) \text{ \AA}$	$\mu = 0.25 \text{ mm}^{-1}$
